Rothamsted Insect Survey Eleventh Annual Summary

L. R. TAYLOR and R. A. FRENCH

Suction traps 1979

Daily samples were collected from 17 April to 4 November 1979 and the *Aphid Bulletins* were issued weekly from 7 May (*Bulletin* No. 1) to 4 November (*Bulletin* No. 26). The 33 aphid taxa listed in Table 1 (a–g) are those in the *Aphid Bulletin*.

In 1979 a new trap at Littlehampton, Sussex replaced North Farm, Pulborough, Sussex on the *Aphid Bulletins*. A trap was also operating at Belfast, N. Ireland and these results appear in Table 1 (a–g).

The trap at Rainham continued to operate throughout the year, but due to pressure of work, the results did not appear on the *Bulletins* between 2 July and 9 September 1979. In addition traps were operating at Stirling and Pathhead in Scotland and North Farm, Sussex. Suction traps sampling at 5 ft (1.5 m) were operating at Dundee, East Craigs, Ingraston, Broom's Barn, Rothamsted Tower and Littlehampton; records for these do not appear in *Bulletins* nor in Table 1.

Catches from Belfast, Aberystwyth, Broom's Barn and Holland were identified by Dr. A. C. Bell, Department of Agriculture, Belfast, N. Ireland; Mr. J. A'Brook of the Welsh Plant Breeding Station; G. D. Heathcote of Broom's Barn Experimental Station and Dr. A. van Harten of Wageningen, respectively. The catches from East Craigs, Pathhead, Stirling and Ingraston were identified by Mrs. L. A. D. Turl and Dr. D. A. Cooper of the Department of Agriculture and Fisheries for Scotland, East Craigs. Dr. H. L. G. Stroyan of the Ministry of Agriculture, Fisheries and Food, Plant Pathology Laboratory confirmed difficult identifications.

The *Bulletin*, despatched each Friday, lists aphids caught between 5 and 12 days earlier, except for Holland, where samples were 12–19 days previously. This timing is dictated by the postal services.

The *Bulletins* cover the working week Monday to Sunday. Table 1 is for standard 4-week periods constant from year to year (see *Rothamsted Report for 1972*, Part 2, 211, Table 4).

Sample volumes were halved at various sites (* see details below) between 20 June and 24 September. In addition, when numbers were high, catches were sub-sampled in the laboratory, to reduce the pressure of work. The weekly *Bulletins* and Table 1 (a–g) are corrected to full volume samples.

In Table 1 (a–g) there are no missing values, a blank records a zero catch.

Light traps

Table 2 (a–f) gives the annual catches during 1977 and 1978 of the same pest, or migratory, Lepidoptera as in previous years. Eighty-four sites completed the 364 day sample for 1978.

The sites on Table 2 are arranged in sequence from north to south and the species are in the same order as in previous years. Zero catches are recorded 0; dashes indicate no record.

Once again voluntary workers operated most traps and identified many of the insects; for their help we are most grateful.

* Sample volumes were halved at Silwood Park from 20–26 June, Hereford 20 June–3 September, Rainham 20 June–13 September. Rothamsted Tower 20 June–17 September. Long Ashton and Writtle 20 June–18 September, Wye 20 June–19 September and Shardlow 20 June–24 September.

ROTHAMSTED REPORT FOR 1979, PART 2

TABLE
The Rothamsted Insect Survey—Suction Traps: four-weekly total catches
