Rothamsted Experimental Station Report for 1986

[Full Table of Content](#)

Rothamsted Insect Survey, Eighteenth Annual Summary

I. P. Woiwod, G. M. Tatchell, Maureen J. Dupuch, E. D. M. Macaulay, Susan J. Parker and M. S. Taylor

I. P. Woiwod, G. M. Tatchell, Maureen J. Dupuch, E. D. M. Macaulay, Susan J. Parker and M. S. Taylor (1987) *Rothamsted Insect Survey, Eighteenth Annual Summary* ; Rothamsted Experimental Station Report For 1986, pp 289 - 321 - DOI: <https://doi.org/10.23637/ERADOC-1-33900>

Rothamsted Insect Survey

Eighteenth annual summary

I. P. WOIWOD, G. M. TATCHELL, MAUREEN J. DUPUCH,
E. D. M. MACAULAY, SUSAN J. PARKER and M. S. TAYLOR

Suction traps 1986

Samples were collected daily from 7 April to 11 November 1986, and weekly for the remainder of the year. These data were included in the *Aphid Bulletin*, which was issued weekly from 28 April (Bulletin No. 1) to 9 November (Bulletin No. 26). The 33 aphid taxa listed in Table 1 (a–h) are those in the *Aphid Bulletin*. The *Aphid Commentary* was issued with the *Aphid Bulletin* on 14 occasions during 1986. This provided regional interpretation of current trap samples for nine of the aphid pests of cereals, potatoes, sugar beet, field beans, peas, apples and hops. These interpretations were also made available via two agricultural viewdata services, Prestel Farmlink and Agviser.

The *Aphid Bulletin* and *Aphid Commentary*, despatched each Friday, provide information on aphids sampled between five and 12 days earlier. This timing is dictated by the postal services.

The *Aphid Bulletin* and *Aphid Commentary* cover the working week Monday to Sunday. Table 1 is for standard four-week periods constant from year to year (see *Rothamsted Report for 1972*, Part 2, 211, Table 4). *Aphid Bulletin* and standard weeks do not correspond in 1986.

The suction traps in Scotland at (916) Elgin, (907) Dundee, (912) East Craigs, (931) Pathhead, (923) Auchincruive, Ayr and also at (925) Stirling were operated and samples identified by Mrs L. A. D. Turl and colleagues at the Department of Agriculture and Fisheries for Scotland (DAFS), East Craigs.

The trap at (927) Belfast was operated and insect samples sorted by Dr A. C. Bell and colleagues of the Department of Agriculture for Northern Ireland.

The trap at (919) Shardlow is now operated by the Soil Survey of England and Wales.

The trap at (911) Aberystwyth is operated by kind permission of the Welsh Plant Breeding Station, by Mr K. Vincent.

The trap (937) at Headley Hall, Tadcaster, only operated from 1 August to 11 November 1986. The results from this trap do not appear in Table 1 nor did they appear in the *Aphid Bulletin* during 1986.

Suction traps sampling at 5 ft (1.5 m) were operating at (954) East Craigs and (951) Rothamsted Tower in 1986. The trap at (956) Ingraston no longer operates. Records for these do not appear in Table 1 nor did they appear in the *Aphid Bulletins*.

Sample volumes were halved at various sites as follows: (901) Rothamsted Tower from 9 August to 1 September, (905) High Mowthorpe, (922) Preston, (934) Kirton, (919) Shardlow, (917) Hereford, (936) Long Ashton, (903) Wye, (933) Littlehampton, from 11 August to 1 September, (924) Writtle from 11 August to 2 September, (937) Tadcaster from 11 August to 3 September, (906) Newcastle from 11 August to 10 September, (904) Broom's Barn 22 and 23 July and from 6 August to 27 August. In addition when numbers were high, catches were sub-sampled in the laboratory to reduce the pressure of work. The weekly *Bulletins* and Table 1 are corrected to full volume sample.

In Table 1 there are no missing values, a blank records a zero catch.

Aphid samples were identified at Rothamsted by Maureen Dupuch, Mark Taylor, Susan Parker, Debbie Riley, Veronica French and Caroline Mitchell; at East Craigs by Dr K. F. A. Walters and Mr F. G. Doyle, Mrs Noreen P. Gourlay and Mrs. L. A. D. Turl of DAFS; at Broom's Barn by Mr W. A. Thornhill and Dr A. M. Dewar. We appreciate their coopera-

ROTHAMSTED REPORT FOR 1986, PART 2

Fig. 1(a) Distribution of 24 12.2 metre suction trap sites operating during 1986.

+ indicate suction trap sites which are: El, Elgin; D, Dundee; St, Stirling; EC, East Craigs; Ph, Pathhead; Ay, Ayr; N, Newcastle; B, Belfast; HM, High Mowthorpe; Ta, Tadcaster; P, Preston; K, Kirton; Sh, Shardlow; A, Aberystwyth; BB, Broom's Barn; H, Hereford; RT, Rothamsted Tower; Wr, Writtle; LA, Long Ashton; SP, Silwood Park; W, Wye; L, Littlehampton; SX, Starcross; R, Rosewarne.

ROTHAMSTED INSECT SURVEY

Fig. 1(b) Distribution of the 66 light trap sites in continuous operation during 1985.

ROTHAMSTED REPORT FOR 1986, PART 2

tion in providing information for the weekly *Aphid Bulletin* and *Aphid Commentary* and for Table 1.

Aphid migration of most aphid species began late in 1986, even later than in the 'late year' of 1985. The primary migration of the apple-grass aphid (*Rhopalosiphum insertum*) was exceptionally large, as expected following the large return migration to apple in the autumn of 1985. In contrast the primary migration of the willow-carrot aphid (*Cavariella aegopodii*) and the leaf-curling plum aphid (*Brachycaudus helichrysi*) were much smaller than usual.

In mid-August, when few migrants are usually recorded, the numbers of many species were unusually large, especially those emigrating from cereals. This was because populations on cereals developed late on crops whose final ripening was delayed.

Light traps

Table 2 (a-f) gives the annual catches during 1984 and 1985 of the same pest, or migratory Lepidoptera as in previous years. Sixty-six sites completed the 364-day sample for 1985.

The sites in Table 2 are arranged in sequence from north to south, and the species in the same order as in previous years. Zero catches are recorded 0; dashes indicate no record.

Records of particular interest continued to be published regularly and these are listed under the references (Riley 1985 a-c, 1986 a-i). Most of these concern new county records or unusual phenology but one noteworthy capture was of *Costaconvexa polygrammata* (the Many-lined Moth) on Jersey. This species was once to be found in the fens of East Anglia but became extinct in the middle of the last century. It remains to be seen whether it is a resident on the Channel Islands. As always we are indebted to the many people who voluntarily run and identify many of the light trap samples. The identification at Rothamsted has been carried out by Adrian Riley.

Maps of trap distribution

This year for the first time we are including maps showing the distribution of the suction and light traps for which data are included in Tables 1 and 2, or mentioned in the text.

There were 24 12.2 m suction traps operating in 1986 (Fig. 1a). Grid references for these sites were published in Taylor *et al.* (1981 Table 1) with the exception of site (937) Tadcaster (SE435406) which started operation in 1985 and site (922) Preston, whose grid reference was corrected in Taylor *et al.* (1985 Table 3).

The distribution of light traps is of the 66 sites which operated continuously during 1985 (Fig. 1b). Grid references for these sites have been published in Taylor *et al.* (1981 Table 2) or Taylor *et al.* (1985 Table 3) except for seven recently started sites. These are listed below.

No.	Name	Grid reference	Years operating		Environmental category	Operator or organization
			1st year	No. years		
456	Lairg	NC 580 060	1985	1	Mixed	M. Canham (FC)
